

## Quick Help - WQ Monitoring

The WQ Monitoring initial screen shows average e.coli found at the Centerville Creek sampling sites by year for 2021, 2022 and 2023 using a bar graph at the sampling location.

A legend in the lower left of the screen provides details about the current screen.

Buttons on the bottom of the screen will display site details for different creeks.

The top menu bar gives a link for the **Hika-Bay** home screen, different **Display options** and a **Description** of the current sampling analysis.

The **Display options** menu gives options for selecting a **Year** (or all years), an analysis to display, **Site Name** and a **Reset** to get back to the initial screen. The Menu Options also has an **Update** button to display the changes you selected. The **Update** button must be pressed to update the screen options.
